

## Andy Fluor™ 647 Azide

| Catalog Number | Packaging Size |
|----------------|----------------|
| C324           | 1 $\mu$ mol    |

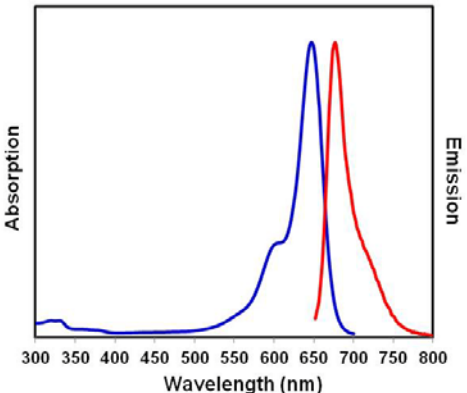

**Storage upon receipt:** -20°C, protected from light

### Introduction

Click chemistry describes a class of chemical reactions that use bio-orthogonal or biologically unique moieties to label and detect a molecule of interest in mild, aqueous conditions. The click reaction involves a copper-catalyzed triazole formation from an azide and an alkyne. The azide and alkyne moieties can be used interchangeably; either one can be used to tag the molecule of interest, while the other is used for subsequent detection.

The Andy Fluor™ 647 azide is reactive with terminal alkyne via a copper-catalyzed click reaction that allows the subsequent visualization by fluorescence spectroscopy.

### Specifications

|                            |                            |  |
|----------------------------|----------------------------|--|
| <b>Label:</b>              | Andy Fluor™ 647            |  |
| <b>Ex/Em:</b>              | 650/666 nm                 |  |
| <b>Detection Method:</b>   | Fluorescent                |  |
| <b>Solubility:</b>         | DMSO, DMF                  |  |
| <b>Product Size:</b>       | 1 $\mu$ mol                |  |
| <b>Storage Conditions:</b> | -20 °C, protect from light |  |
| <b>Shipping Condition:</b> | Room Temperature           |  |

### Applications

Click chemistry labeling
